<p><u>Abstract</u></p> <p>The European Social Survey (ESS) is an academically-driven multi-country survey, which has been administered in over 30 countries to date. Its three aims are, firstly – to monitor and interpret changing public attitudes and values within Europe and to investigate how they interact with Europe's changing institutions, secondly - to advance and consolidate improved methods of cross-national survey measurement in Europe and beyond, and thirdly - to develop a series of European social indicators, including attitudinal indicators.</p> <p>In the eighth round, the survey covers 23 countries and employs the most rigorous methodologies. From Round 7 it is funded by the Members, Observers and Guests of ESS European Research Infrastructure Consortium (ESS ERIC) who represent national governments. Participating countries directly fund the central coordination costs of the ESS ERIC, as well the costs of fieldwork and national coordination in their own country.</p> <p>The survey involves strict random probability sampling, a minimum target response rate of 70% and rigorous translation protocols. The hour-long face-to-face interview includes questions on a variety of core topics repeated from previous rounds of the survey and also two modules developed for Round 8 covering Public Attitudes to Climate Change, Energy Security, and Energy Preferences and Welfare Attitudes in a Changing Europe (the latter is a partial repeat of a module from Round 4).</p>

Sampling

Sampling Procedure

Please see: <http://www.europeansocialsurvey.org/essdoc/doc.html?year=2016&ddi=2.3.1.4>

Response Rate

Please see: <http://www.europeansocialsurvey.org/essdoc/doc.html?year=2016&ddi=2.3.3.1>

Weighting

DESIGN WEIGHTS:

The purpose of the design weights (DWEIGHT) is to correct for unequal probabilities for selection due to the sampling design used.

In general design weights were computed for each country as follows.

1. $w = 1/(\text{PROB1} * \dots * \text{PROBK})$ is a $n \times 1$ vector of weights ; k depends on the number of stages of the sampling design.
2. All weights were rescaled in a way that the sum of the final weights equals n, i.e. Rescaled weights = $n * w / \text{sum}(w)$.

POST-STRATIFICATION WEIGHTS:

The purpose of the post-stratified design weights (PSPWGHT) is to reduce sampling error and non-response bias, using auxiliary information. The post-stratification targets use information about age, gender, education and region. Raking (iterative proportional fitting) has been used in the production of the post-stratified weights, using the ipfweight procedure in Stata v15. For most countries population targets are weighted estimates from the European Union labour force survey 2016 (Eurostat). Exceptions are Israel (Israeli Central Bureau of Statistics website), Russia (Census 2010; data from ESS NC), Sweden (Statistics Sweden website), Netherlands (ESS NC for region (other variables from ELFS)) and Austria (Statistics Austria website for region (other variables from ELFS)).

POPULATION SIZE WEIGHTS:

The Population size weight (PWEIGHT) corrects for population size when combining two or more country's data, and is calculated as $\text{PWEIGHT} = [\text{Population aged 15 years and over}] / [(\text{Net sample in data file}) * 10\,000]$

Source population figures: Eurostat. For Israel and Russian Federation ESS8 Appendix A5 Population Statistics.
